The Emblazons are in high demand and this one shows why.

Yearling Bulls

After purchasing Sweetness from DeRouchey Cattle Co. two years ago, I knew that combining him with our SimAngus cows was going to be a great combination. These bulls are from his first calf crop and as evidenced by their overall quality as a group, Sweetness has proven his worth. As well, outstanding sons of the other two Maine bulls that I purchased that same year are offered. The Rampage sons are what is expected from the Euchee bloodline, the outstanding sire of Buck Cattle Co. The Mastermind cattle bring great genetic merit in their own right from Gregory Farms. Out of their proven JDS Stout donor, Mastermind is a full sib to other outstanding promoted AI sires like 24-7, and others. Two powerful Goliath sons also sell in this offering of yearling Maine influence bulls, paternal sibs to the Reserve Grand Maine-Anjou heifer at the Fort Worth, Junior Maine Show. The SimAngus offering is as equally impressive in this set of yearlings. With Meyer 734, New Plan, 409P, and Hot Sauce well represented.

These yearling bulls will not post the impressive rates of gain as other yearling bulls developed on test, consuming high concentrate rations. These bulls have been developed on short wheat and supplemented with silage and chopped hay and limited grain. The fat thickness from the carcass ultrasound reflects that most of these bulls are carrying less than 0.10" of cover. They are in good condition and are ready to use.

Statement on PHA testing and practical management of PHA carriers:

PHAF – bulls tested free from the PHA allele

PHAC – bulls tested as carriers for the PHA allele

PHA stands for Pulmonary Hypoplasia with Anasarca. Simply put it is a birth defect that became evident from the result of line breeding closely related bloodlines together over time. It works just like the recessive red gene that we all learned about in basic biology. If you mate two carrier animals together you have a 25% chance of having a PHA calf, a 50% chance of having a carrier that shows no visible signs of the defect and is completely normal, and a 25% chance of having a genetically free animal.

Using a carrier animal in a herd of cows with no Maine or Shorthorn influence is completely safe and practical. These carrier animals will transmit this allele to approximately 50% of their offspring. Carrier offspring will be as normal as the rest and will grow and perform as well if not better than the average. **Practical use of a PHA carrier sire should be as a terminal, growth and performance sire only.** If you choose to retain replacements from a carrier sire, these replacements should be tested for PHA. Testing information can be found on the Maine-Anjou website at www.maine-anjou.org.

Sale Procedure:

All bulls will sale private treaty. Be sure to register for a **buyer number**. The listed price is the minimum or floor price for each lot. Each bull is listed by lot number on the board with his floor price.

At anytime before 1:30 pm on Saturday afternoon you would like to bid on a bull you may put your **buyer number** on the board next to your selection with your bid in the **bid box** replacing the starting price. **At anytime before 1:30 pm on Saturday afternoon another buyer would like to raise the bid on a bull which has already been bid upon, they may do so by simply requesting to erase the current bid and raise the bid by a minimum of \$100.00, placing the new bid in the bid box and buyer number next to the lot number.**

At approximately 1:30 pm on Saturday afternoon we will bid-off those bulls that have been bid upon, giving anyone present or making arrangements to bid by phone the opportunity to purchase any bull in the offering. Again increases will be in a minimum of \$100.00 increments. After the bid-off all remaining lots in the offering will be for sale at the starting price on a first come first serve basis.

Herd Health and Development:

- All bulls have passed a recent breeding soundness exam and are approved ready for service by a Dr. Jeff Pollock DVM.
- All bulls at Purvine Farms have been through a strict and regimented herd health routine beginning at 2 months of age, preventing IBR, BVD, BRSV, PI3 (using both modified live and attenuated vaccines), Blackleg, Lepto, Vibrio, Pinkeye, Haemophilus Somnus, and Micoplasm.
- All bulls have been dewormed recently with Ivomec (internal and external control), in combination with SafeGuard (internal control) and Saber (external control).
- All bulls have been tested for Persistently Infected carriers of BVD and are free, by Cattle Stat LLC.
- Purvine Farms bulls have been developed utilizing wheat pasture with minimal supplementation of a silage based ration including chopped hay, with rolled corn and dried distillers grains for protein supplement, with Rumencin and Vitafirm Conceptaid added to maximize efficiency.
